

## DERMAL FILLER REMOVAL AND CORRECTION

### WHAT IS FILLER REMOVAL/REVERSAL?

Hyalase (Hyaluronidase) is an enzyme which breaks down hyaluronic acid (HA) fillers. Hyalase acts to make the tissue between cells more permeable. This allows filler to be rapidly dispersed and absorbed.

This can be down to your filler results not being as you had hoped, overfill of dermal filler in the area (i.e., filler migration) or if in case of an emergency.

Jemma is highly knowledgeable and skilled in the use of Hyalase (hyaluronidase) to effectively and safely:

- Dissolve Unwanted Dermal Fillers
- Reverse Overly-Filled Cheeks and Lips

Hyalase (Hyaluronidase) however, is not always necessary, this is an invasive procedure and Jemma will discuss further options available. I.e. if you only have some unwanted lumps or bumps that are formed from particular filler brands, these can be removed by your practitioner without the use of Hyalase treatment.

It is extremely important that you advise your practitioner of any allergies you may have prior to your appointment.

### **Treatment summary**

Treatment Time: c. 1 hr

Recovery: 2-5 days

Possible Side Effects: Bruising

**Treatment Cost:** £200
